

COLD STORAGE PROJECT

Most cold storage facilities are constructed using preinsulated panels (metal panels with foam sandwich cores). Because thermal leaks are the major concern in these structures, sprayed-in-place two component polyurethane foams have become an important part of the construction process. FOAM IT GREEN® is a convenient and portable way to apply foam to the various junctions in the cold storage structure. It is used to seal the juncture where the roof meets the wall, wall and ceiling junctures on the interior, floor to wall junctions, and in corners.

Choose our **standard** foam formula for your cold storage construction needs.
